

Matrix Systems' Frontier Access Control Software **Press Release**

For Immediate Release

Matrix Systems Releases the Frontier Integrated Platform v. 4.8 -- Another Step Toward the Future

It's a nightmare scenario for a security manager: a seemingly secure, fully vetted employee runs into serious personal problems. Maybe he's assisting criminals to pay off gambling debts. Maybe he's stealing narcotics for a drug-addicted girlfriend. For whatever reason, he has morphed into a ticking time bomb.

Security threats today are dynamic and evolving. That's why the Federal Information Processing Standards (FIPS) were created. And now, with its latest release of Frontier Software, Matrix has added a Personal Identity Verification (PIV) Class Interface to support a variety of FIPS 201-2 cards.

"At its core, security is always going to be about the next threat, not the last one," says Matrix CEO Bruce Rogoff. "Our goal is to provide a truly open platform and Frontier's new Web API is a critical step in that direction."

"An upgrade release is our opportunity to address 'real-world' issues," notes Jeff Stout, VP of Sales and Marketing. "Our customers need to optimize their human resources, deploy new technology quickly and do more with less. The Web API will make a meaningful difference."

Matrix Systems has been designing, installing and maintaining access control systems for nearly 40 years. They deliver technology-based solutions to industries including transportation, healthcare, education and government.
